No results of practical importance seem to flow from this assumption (pp. 145-6). 1603. () Case of $\text{dadr } 0$ in equations (lxv), or the least principal traction making the same angle with a radius-vector at every point of its length (pp. 145-56). R_p being a constant, we have in this case: $a j C (da, J c - \cos 2a$ where $C, C,$ and c are arbitrary constants. Boussinesq applies results (lxx) to the consideration of the special case, where a cylindrical sector of material is placed between two intersecting rigid planes, sufficiently rough to stop all sliding of the particles of the material touching them. The application to the case where the rigid planes are hinged to a common axis and squeeze a wedge of plastic material placed between them might possibly have some practical interest. 1604. To the memoir is appended a Note Complementary:...
